clearcare.

The next steps, made clear.

Understand discharge instructions.
Feel more ready for the days ahead.

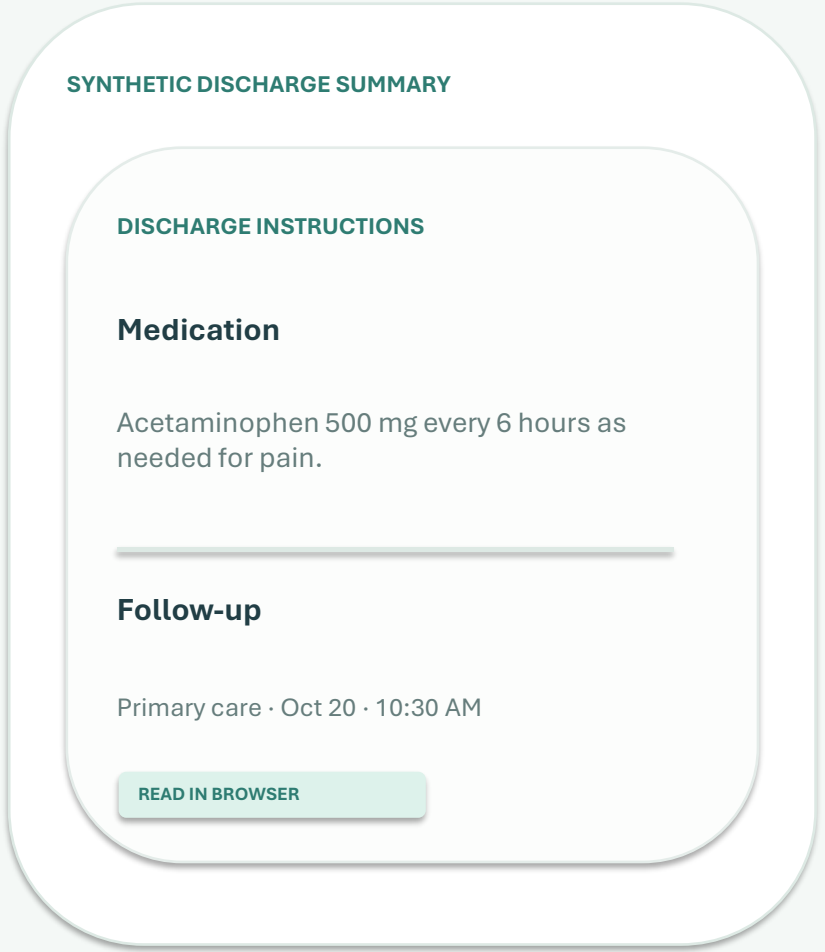

AMD DEVELOPER CLOUD · TOKEN FACTORY

Synthetic demo · Source-grounded · Not medical advice

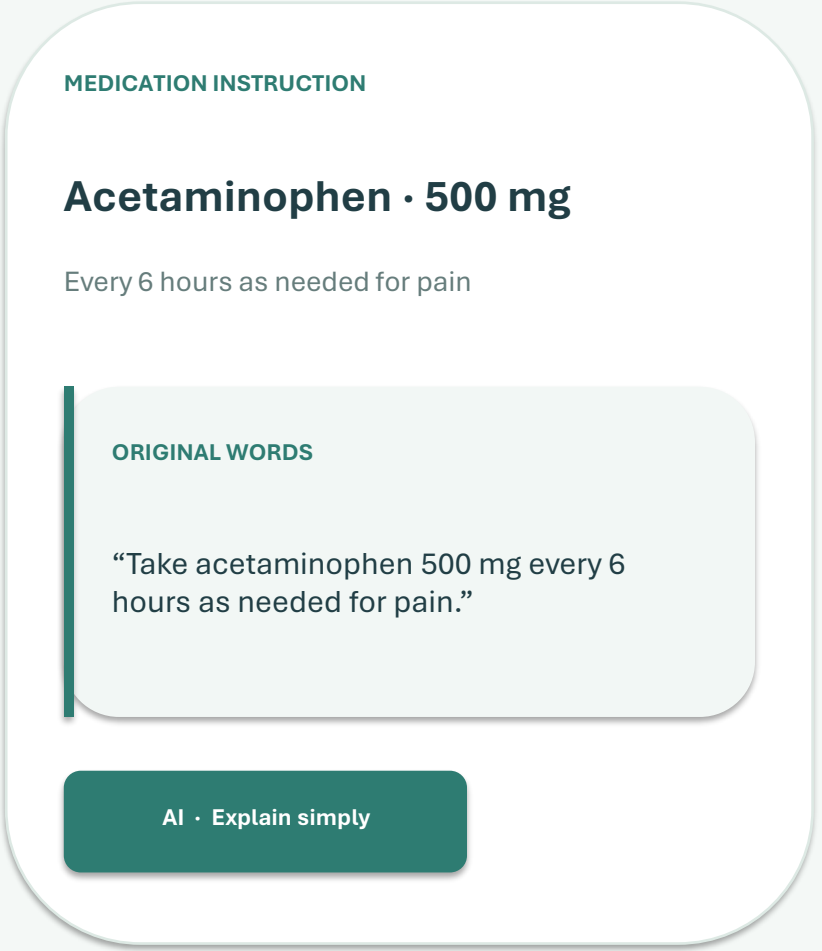

Start with the document.

Select a text-based discharge PDF. The demo reads it in the browser and keeps the selected file in the current session.

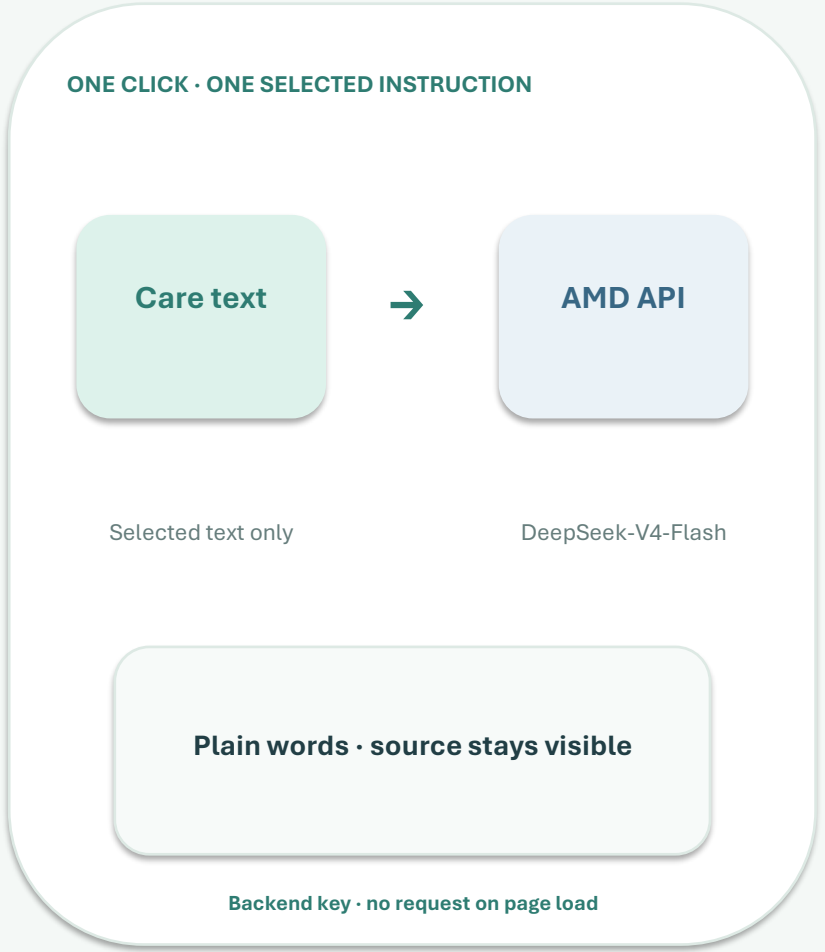

Keep each instruction grounded.

Medication directions and care steps stay paired with the exact words found in the document, so families can compare the summary with its source.

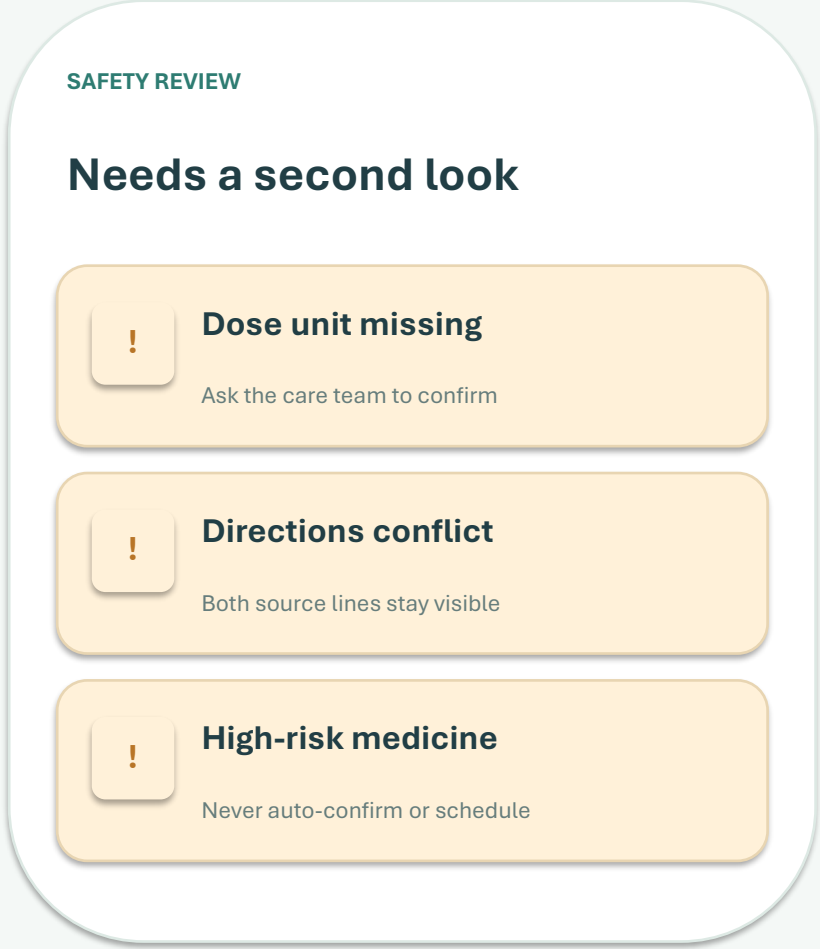

Explain simply, when you ask.

A person chooses Explain simply on one instruction. ClearCare sends that selected text to the backend AMD service for a short plain-language explanation.

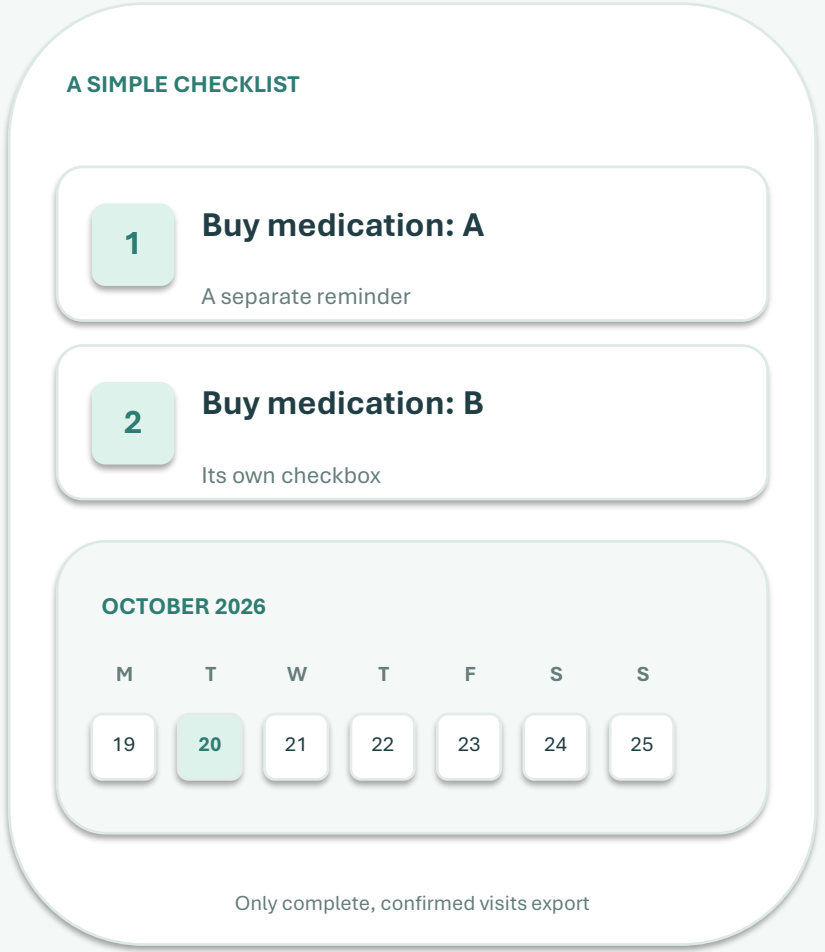

Unclear stays unclear.

Missing units, ambiguous doses, conflicting directions, and high-risk medicines are marked for review. ClearCare does not guess or mark them confirmed.

A plan that fits real life.

Every task has its own checkbox. Confirmed appointments can be shown on the calendar and exported as an .ics file; items needing review stay out.

Make the plan easier to use.

English, Spanish, and Hindi are available in Settings. Today · Hear my day adds a readable transcript, browser voice controls, and document questions.

Voice availability depends on the device.

AI that knows its limits.

AMD Token Factory is a hosted API integration. The API key stays on the backend. ClearCare does not use ROCm or run the model on the patient's device.

THE REQUEST PATH

01 **Patient chooses**
one explanation

02 **ClearCare backend**
holds the secret key

03 **AMD Token Factory**
DeepSeek-V4-Flash

04 **Verified result**
shown with source

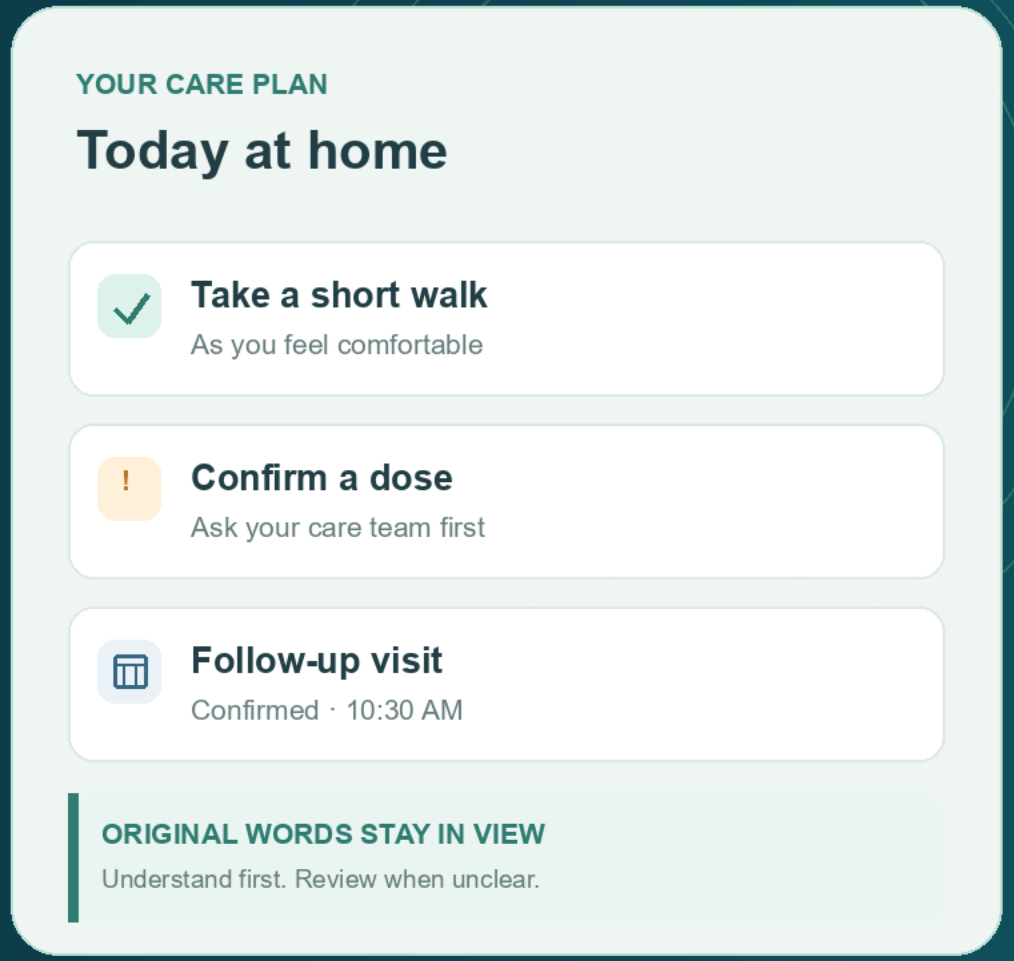

Not ROCm · no local model runtime
